Pilot Burners
and Accessories

BASO has been designing pilot burners for over 60 years to meet various customer applications. Today we have over 200 different configurations to meet your specific needs. The "J" Series pilot burners are used with intermittent pilot ignition or standing pilot ignition systems. These pilot burners use BASO inlet fittings with a unique dual orifice design allowing for better pilot flame stability. Many models are also available as "universal" designs which allows for adaptation to almost any field application. These universal models contain all the required accessories for field replacement on Natural and LP gas applications. Contact BASO Gas Products for details required to meet any specific application. For almost a century, BASO & quality have remained synonymous.
